

Creacion de archivo .yaml y creacion de la conexion:

The image shows a Visual Studio Code editor with a Docker Compose YAML file named `docker-compose.yml` open. The file is located in a project named `Pgadmin` under a `data` directory. The YAML file defines a PostgreSQL service with the following configuration:

```
version: '3.8'

services:
  postgres:
    image: postgres:17
    container_name: postgres173CV231AG02026
    environment:
      POSTGRES_DB: postgres
      POSTGRES_USER: postgres
      POSTGRES_PASSWORD: postgres
    ports:
      - "5432:5432"
    volumes:
      - ./data:/var/lib/postgresql/data
    restart: unless-stopped
```

Below the editor, the terminal window shows the output of the `docker compose up` command. It displays the PostgreSQL init process, the start of the PostgreSQL 17.11 service, and the listening ports (5432). The terminal also shows a warning message from Docker Compose regarding the deprecated `version` attribute in the YAML file.

Prueba de persistencia:

The image shows two side-by-side windows. The left window is VS Code with a terminal running Docker commands. The right window is pgAdmin 4 showing the server hierarchy.

VS Code Terminal Output:

```
